### Ataxia-Telangiectasia

"ay-TACK-see-uh Teh-LAN-jick-TAY-sha"

#### about A-T

- Ataxia-telangiectasia (A-T)...
  - is a rare genetic disease
  - attacks in early childhood
  - progressively affects coordination
  - predisposes patients to fatal cancers
  - severely compromises the immune system
- Children with A-T are...
  - as rare as one in 40,000 births
  - from all races and ethnicities
  - usually unable to walk by age 10
  - may not survive their teens
- Carriers of mutated copies of the A-T gene are about one per 100 individuals in the general population
- Compared to the typical population, the cancer rate of children with A-T is 1000 times higher, and the cancer rate of carriers can be up to four times higher

#### A-T Children's Project research

- Gene therapy to deliver the correct gene to the cells of people with A-T
- Screening chemical compounds to find those with the greatest potential to help A-T
- A-T Clinical Center at Johns Hopkins where clinician/scientists are conducting studies to minimize life-threatening lung complications, reduce eye movement abnormalities and tremors, discover abnormal levels of specific proteins in cerebrospinal fluid of patients with A-T that may lead to new drug targets

#### public health implications

- Gene therapy protocol for A-T could ultimately help other genetic neurological diseases
- Unraveling the A-T gene's function has shed new light on cancer, metabolic syndrome & HIV/AIDS
- Understanding why brain cells die in A-T could provide insight to why brain cells die in other neurodegenerative diseases like Alzheimer's
- Research into the immunological problems of A-T may offer insight into other immune diseases
